

# Axle Load Indicator

## AXL300 *Single Sensor*

The AXL Series is a range of axle load measuring devices for convenient real-time monitoring of axle load on vehicles. It is designed for a pneumatic suspension system (air-bags).

After initial calibration, the embedded micro-controller calculates and displays the axle load from the suspension system air pressure. The piezo resistive ceramic pressure sensors are directly mounted on the circuit board, eliminating the use of interconnecting sensor cables.

## AXL302 *Dual Sensor*

The dual sensor axle load indicator is ideal for vehicles fitted with dual independent air bag suspension, per axle or axle group. The air pressure is measured with the dual sensor and the indicator displays the current axle load.

2 Independently Adjustable Alarms

5 Digits SUPER-BRITE LED Display

3 Selectable Display Modes

Display Mode Over-Ride Control

Watertight & Robust Engineering Plastic Enclosure

Simple 2 Stage Calibration Process

### Application

Truck / Fleet
